

Program

1. Write a module containing functions to convert from decimal to binary, hex and octa.
Import these modules and use them
2. Use os module to check if a file called "data.txt" is present or not, if not, create one with some data
3. Write two modules, one containing functions that convert from decimal to other types (bin, hex, oct) and second one containing functions that convert other types to decimal.
Write a program that import these modules and convert as per user request
4. Write a program that import the above module using import command and use these functions.
5. Write a program that import the above module using "from module import" command and overwrite one of these functions.
